

IN THE CLAIMS:

Please add new claims 43-77 as follows:

1. (Original) A method for providing multicast services in a radio communication system, the method comprising:  
performing Internet protocol header compression to form header compressed data; and  
transmitting the header compressed data in a point-to-point manner and in a point-to-multipoint manner depending upon a threshold value, to one or more users of the radio communication system.
2. (Original) The method of claim 1, wherein the point-to-point manner is employed if a total number of users within a cell is below the threshold value.
3. (Original) The method of claim 1, wherein the point-to-multipoint manner is employed if a total number of users within a cell is at or above the threshold value.
4. (Original) The method of claim 1, wherein the Internet protocol header compression is respectively performed for each type of multicasting service to be provided.
5. (Original) The method of claim 1, wherein the point-to-point manner is transmitting data from a single sending point to a single receiving point.
6. (Original) The method of claim 5, wherein the point-to-point manner is based upon a total number of users within a cell of the radio communication system.
7. (Original) The method of claim 5, wherein the point-to-point manner is performed in a serving radio network controller (SRNC).
8. (Original) The method of claim 7, wherein the transmitting by point-to-point manner is via a dedicated channel.

9. (Original) The method of claim 1, wherein the point-to-multipoint manner is transmitting data from a single sending point to multiple receiving points.

10. (Original) The method of claim 9, wherein the point-to-multipoint manner is based upon a total number of users within a cell of the radio communication system.

11. (Original) The method of claim 9, wherein the point-to-multipoint manner is performed in a controlling radio network controller (CRNC).

12. (Original) The method of claim 11, wherein the transmitting by point-to-multipoint manner is via a common channel.

13. (Original) The method of claim 1, wherein the header compression is performed at a central location for each type of multicast service.

14. (Original) The method of claim 13, wherein the central location is a packet data convergence protocol (PDCP) entity.

15. (Original) The method of claim 14, wherein the PDCP entity is located within a controlling radio network controller (CRNC).

16. (Original) The method of claim 1, wherein a multicast service is a service that is provided to a specified plurality of users.

17. (Original) The method of claim 16, wherein the multicast service is multimedia broadcast / multicast service (MBMS).

18. (Original) A method of receiving data of a multicast service in a radio communication system, the method comprising:

receiving header compressed data in a point-to-point manner and in a point-to-multipoint manner depending upon a threshold value; and

decompressing the received header compressed data to allow a user to access the multicast service.

19. (Original) The method of claim 18, wherein the point-to-point manner is receiving data by a single receiving point from a single sending point.

20. (Original) The method of claim 19, wherein the point-to-point manner is based upon a total number of users within a cell of the radio communication system.

21. (Original) The method of claim 19, wherein the receiving by point-to-point manner is via a dedicated channel.

22. (Original) The method of claim 18, wherein the point-to-multipoint manner is receiving data by multiple receiving points from a single sending point.

23. (Original) The method of claim 22, wherein the point-to-multipoint manner is based upon a total number of users within a cell of the radio communication system.

24. (Original) The method of claim 22, wherein the receiving by point-to-multipoint manner is via a common channel.

25. (Original) The method of claim 18, wherein a multicast service is a service that is received by a specified plurality of users.

26. (Original) The method of claim 25, wherein the multicast service is multimedia broadcast / multicast service (MBMS).

27. (Original) The method of claim 18, wherein the header decompressing is performed at a packet data convergence protocol (PDCP) entity.

28. (Original) In a radio communication system for providing and receiving data of a multicast service, a radio network controller comprising:

a header compressing portion that performs Internet protocol header compression; and  
a transmitting portion, operatively connected with the header compressing portion, that transmits the header compressed data in point-to-point manner and in a point-to-multipoint manner depending upon a threshold value, to one or more users of the radio communication system.

29. (Original) The radio network controller of claim 28, wherein the header compressing portion is a packet data convergence protocol (PDCP) entity.

30. (Original) The radio network controller of claim 28, wherein the header compressing portion respectively performs header compression for each type of multicasting service to be provided.

31. (Original) The radio network controller of claim 29, wherein the transmitting portion is a serving radio network controller (SRNC).

32. (Original) The radio network controller of claim 31, wherein the SRNC transmits via a dedicated transport channel.

33. (Original) The radio network controller of claim 29, wherein the transmitting portion is a controlling radio network controller (CRNC).

34. (Original) The radio network controller of claim 33, wherein the CRNC transmits via a common transport channel.

35. (Original) In a radio communication system for providing and receiving data of a multicast service, a user equipment comprising:

a receiving portion, that receives in a point-to-point manner and in a point-to-multipoint manner, Internet protocol header compressed data; and

a header decompressing portion operatively connected with the receiving portion, the header decompressing portion decompressing the header compressed data to access the multicast service.

36. (Original) The user equipment of claim 35, wherein the header decompressing portion is a packet data convergence protocol (PDCP) entity.

37. (Original) The user equipment of claim 35, wherein the header compressing portion respectively performs Internet protocol header compression for each type of multicasting service to be provided.

38. (Original) The user equipment of claim 35, wherein the receiving portion receives the data in a point-to-point manner from a serving radio network controller (SRNC).

39. (Original) The user equipment of claim 38, wherein the receiving portion receives via a dedicated transport channel.

40. (Original) The user equipment of claim 35, wherein the receiving portion receives the data by a point-to-point manner from a serving radio network controller (CRNC).

41. (Original) The user equipment of claim 40, wherein the receiving portion receives via a common transport channel.

42. (Original) A method for providing multicast services in a radio communication

system, the method comprising:

performing Internet protocol header compression to form header compressed data; and  
transmitting the header compressed data in a point-to-multipoint manner according to a  
type of multicast service to one or more users in the radio communication system.

43. (New) A method of providing data including at least one header to a plurality of  
terminals in a wireless communication system, the method comprising:

performing compression of at least part of the at least one header to form a compressed  
header in a header compression module in a network communicating with the plurality of  
terminals; and

transmitting the data comprising the compressed header to at least one terminal of the  
wireless communication system, wherein the number of terminals is greater than the number of  
header compression modules in the network.

44. (New) The method of claim 43, wherein the header is an Internet protocol  
header.

45. (New) The method of claim 43, wherein the data comprising the compressed  
header is transmitted to the plurality of terminals using a common channel.

46. (New) The method of claim 43, wherein the data comprising the compressed  
header is transmitted to the plurality of terminals in one of a point-to-point and a point-to-  
multipoint manner.

47. (New) The method of claim 46, wherein the selection of one of the point-to-point  
manner and the point-to-multipoint manner is determined using a predetermined requirement  
associated with a number of terminals communicating with the network.

48. (New) The method of claim 43, wherein at least part of the data comprising the  
compressed header is not compressed by the header compression module.

49. (New) The method of claim 43, wherein the header compression module is associated with a packet data convergence protocol layer of the network.

50. (New) The method of claim 43, wherein the header compression module is associated with a controlling radio network controller.

51. (New) A method of providing Internet protocol header information to a plurality of terminals in a wireless communication system, the method comprising:

performing header compression of Internet protocol header information to form compressed header data; and

transmitting the compressed header data to at least one terminal of the communication system in one of a point-to-point manner and a point-to-multipoint manner depending upon a threshold value.

52. (New) The method of claim 51, wherein header compression is performed once for the data transmitted to a plurality of terminals when the data is transmitted in a point-to-

multipoint manner.53. (New) The method of claim 51, wherein the compressed header data is provided to a plurality of terminals when the data is transmitted in a point-to-multipoint manner.

53. (New) The method of claim 51, wherein the compressed header data is provided to a plurality of terminals when the data is transmitted in a point-to-multipoint manner.

54. (New) The method of claim 51, wherein the threshold value is associated with a number of terminals.

55. (New) The method of claim 51, wherein the compressed header data is transmitted to the at least one terminal using a common channel.

56. (New) The method of claim 51, wherein at least part of the Internet protocol

header information is not compressed.

57. (New) The method of claim 51, wherein the header compression is performed at a packet data convergence protocol layer.

58. (New) The method of claim 51, wherein the header compression is performed at a controlling radio network controller.

59. (New) A method of providing internet protocol header information to a plurality of terminals in a wireless communication system, the method comprising:

performing compression of internet protocol header information to form compressed header data and providing the compressed header data on a common logical channel;

transmitting the compressed header data to a plurality of terminals in a point-to-multipoint manner wherein the compressed header data is mapped to a common physical channel accessible by a plurality of terminals; and

receiving and decompressing the compressed header data on the common physical channel at the plurality of terminals.

60. (New) The method of claim 59, wherein at least part of the internet protocol header information is not compressed.

61. (New) The method of claim 59, wherein the compression of the internet protocol header information is performed at a packet data convergence protocol layer.

62. (New) The method of claim 59, wherein the compression of the internet protocol header information is performed at a controlling radio network controller.

63. (New) The method of claim 59, wherein the compressed header data is transmitted to the plurality of terminals in the point-to-multipoint manner over a wireless path.

64. (New) The method of claim 59, wherein the compression of the internet protocol header information and mapping of the compressed header data to the common physical channel is over a wired path.

65. (New) A method of providing internet protocol header information in a wireless communication system, the method comprising:

providing internet protocol header information from an internet protocol module to a header compression module associated with one of serving network control equipment and controlling network control equipment;

performing compression of the internet protocol header information in the header compression module to form compressed header data; and

transmitting the compressed header data to at least one terminal of the communication system in one of a point-to-point manner and a point-to-multipoint manner depending upon a threshold value and wherein the compressed header data is provided to a plurality of terminals when the data is transmitted in a point-to-multipoint manner.

66. (New) The method of claim 65, wherein the compressed header data is transmitted in the point-to-point manner if the number of users is below the threshold value.

67. (New) The method of claim 65, wherein the compressed header data is transmitted in the point-to-multipoint manner if the number of users is at or above the threshold value.

68. (New) The method of claim 65, wherein the compression of the internet protocol header information is performed at a packet data convergence protocol layer.

69. (New) The method of claim 65, wherein the transmission of the compressed header data to the at least one terminal comprises a multicast service.

70. (New) The method of claim 69, wherein the multicast service is multimedia broadcast multicast service .

71. (New) A wireless communication system for providing internet protocol header information to a plurality of terminals, the wireless communication system comprising:

a header compression module adapted to receive internet protocol header information from an internet protocol module and compress the internet protocol header information to form compressed header data;

a transmitting module adapted to transmit the compressed header data to at least one user of the communication system in one of a point-to-point manner and a point-to-multipoint manner depending upon a threshold value; and

a receiving module adapted to receive and decompress the compressed header data.

72. (New) The wireless communication system of claim 71, wherein the compressed header data is provided to the plurality of terminals when the data is transmitted in a point-to-multipoint manner.

73. (New) The wireless communication system of claim 71, wherein the header compression module is associated with one of serving network control equipment and controlling network control equipment.

74. (New) The wireless communication system of claim 71, wherein the compressed header data is transmitted in the point-to-point manner if the number of terminals is below the threshold value.

75. (New) The wireless communication system of claim 71, wherein the compressed header data is transmitted in the point-to-multipoint manner if the number of terminals is at or above the threshold value.

76. (New) The wireless communication system of claim 71, wherein the header compression module is a packet data convergence protocol entity.

77. (New) The wireless communication system of claim 71, wherein the header compression module is part of a controlling radio network controller.
